

USE/ADVANTAGE - These MEC are universal donor cells used e.g. for reconstruction of vascular linings (partic. following balloon angioplasty for coronary arterial disease) and for delivery of therapeutic agents. They can be protected against acute rejection (complement-induced lysis); are not subject to attack by T cells and may include a suicide mechanism.

the upregulation of the activation markers CD23 and CD25 on B and T cells, resp. However, approx. five-fold higher concns. of mitogen than those used for suspension cultures were needed. Taken together, the system presented here constitutes a potent tool for the investigation of the complex interactions leading to activation and differentiation of B and T cells in lymphoid organs.
